Business Overview:

Name of the small business:

Ojo Vision

Brief History of the small business:

Ojo Vision is a photography business focused on capturing meaningful moments, people, events, and creative visual experiences through photography. The business was established from a passion for photography and visual storytelling, with the aim of helping clients preserve important memories and present themselves professionally through high-quality images. Ojo Vision provides creative photography services while continuously developing its visual style and expanding its portfolio.

Mission and Vision Statement:

Mission Statement: The mission of Ojo Vision is to provide high-quality, creative, and professional photography services that capture meaningful moments and tell unique visual stories. The business aims to understand each client's vision and transform it into memorable and visually appealing photographs.

Vision Statement: The vision of Ojo Vision is to become a recognized and trusted photography brand known for creativity, professionalism, quality and authentic visual storytelling.

Target Audience:

Ojo Vision's target audience includes individuals, students, graduates, couples, families, artists, small businesses, brands, and organizations that require professional photography services. The business particularly targets clients looking for creative, affordable and high-quality photography for personal memories, events, social media content, portfolios, and professional branding.

Website Goals and Objectives:

Goals for my website:

The main goal of my website is to create a professional, user-friendly website that can provide viewers with clear information about the business and its products or services. The website should be easy for the user to find information, contact the person who designed the business, and to take action by making an enquiry or purchasing the owner of the business product or service.

What I need for this website is to provide useful information for users to know about the small business, its products or services, prices, and contact information.

I need to make the website look professional but also be creative with websites so that it can catch the attention of the users so that they can recommend it to other people they know around them.

I need to increase the website traffic so that the users can have an easy way to find the website through search engines and share them on social media. I also need to improve customer experience by providing simple navigation and information that can be easy to understand. I also need to increase the conversion so that I can encourage customers to contact the person who owns the business, request information, purchase products, or use the service offered.

Key Performance Indicators (KPIs):

- How many users will have access to the website
- The number of products or service that will be viewed on the website
- How many users leaving the website without interacting with it
- Where the user come from such as social media or search engines
- The total number of pages loaded and viewed by users
- How many pages a user clicks through before they exit
- How fast the website can fully render in the user's browser

Current Websites Analysis:

Analyze the strengths and weaknesses of the website:

Strengths:

- Provides basic information about the small business.
- Contains the contact information and the location of the person who is responsible for the product or services they provide.
- Contains a recognizable logo and brand identity.
- Provides information about the product or services they advertise

Weaknesses:

- The website might have an outdated design.
- Navigation might be confusing or difficult to use.
- Important information may be hard to find.
- Website pages may load slowly because of the large images or unnecessary content.
- The website may not have sufficient information about the products or services provided.
- Contact forms may be missing or difficult to use.

Areas for Improvement:

When creating a website, there are a few bits of improvements we can add to the website that I will be creating. These are the following improvements:

- Optimize media: Compress every image by using an image resizer before uploading them
- Convert formats: Use modern images rather than using heavy JPEG or PNG files
- Test speed: Run the site through Google PageSpeed Insights to find specific slow scripts
- Simplify menus: Limit my main navigation bar to at least few clear links
- Break up text: Convert long paragraphs into short, punchy paragraphs of the two to three sentences
- Refine my headline: Place a clear statement at the very top of my homepage

Proposed Website Features and Functionality:

Homepage: The homepage will provide the user with a quick introduction to the business that has been created. It will include the business name, logo, a short description, a main image, and a clear call-to-action such as “Contact us” or “View Products or Services”.

About us Page: The About Us page will explain what the business is, its history, mission, vision, and the values. The page will help build the trust of the users.

Products/Services Page: This page will display the product or service that can be included in an image, name, description, price where applicable, and a button that allows the user to request more information or make a purchase.

Contact Page: The Contact page will provide the business contact details, including telephone number, email address, physical location and contact form. The form can allow users to enter their name, email address, subject, and message.

Design and User Experience:

My website must be modern, professional and simple with the appearance that I’m going to go for. The website will still be professional, but I’m going to add a bit more color to the website because of the business that I will be promoting and developing a website for the business.

The color scheme of the website is going to be a bit different from other professional websites I have seen and researched. The color scheme will contain some red, black, and white and a bit different since the small business is based on photography, so there are going to be some other colors that will suit the website better.

Typography:

The website will use simple and readable fonts such as the Sans font, Arial or large, bold fonts for the headings and subheadings. The body text will have small and easy fonts that are readable for the users, and I might add buttons for the navigation to be easier for the users.

Layout and Design Approach:

The layout of the website will turn out clean and structured. The navigation bar will be positioned at the top of the page. Each of the core pages will have content that will be divided into different pages to provide users with different information on different pages.

User Experience Considerations:

For good user experience, the website will include:

- Simple navigation
- Readable Texts
- Fast loading images
- Consistent page layouts
- Clear information
- Good contrast between text and backgrounds

Technical Requirements:

The website will require suitable hosting and a domain name so that it can be accessed online. The domain name will be a short, memorable, and professional domain name that should be selected. The domain name should be related to the business name or brand. The website will need to have a web host to help store its files and try to make it available to users.

The following programming languages I will be using:

- HTML on the Visual Studio
- CSS for the style and colors
- JavaScript for the interactivity and the dynamic functionality

The website will include:

- A clear business goal
- Fast and secure hosting like HTTPS
- Simple user navigation
- Core pages like Homepage, About Us Page, Product/Services Page and Contact Page

Timeline and Milestones:

In this week of the project:

I had to do research about websites and how I can improve the website to make it more interesting and professional for the users to interact with the website. I had to plan the website structure, content, color scheme, and typography. I will be developing my html website by creating the core pages of a website.

Milestone:

The main milestones are:

Milestone 1: Requirements and research completed.

Milestone 2: Website structure and wireframes completed.

Milestone 3: Website design completed.

Milestone 4: Main website pages developed.

Milestone 5: Functionality and responsiveness completed.

Milestone 6: Testing and debugging completed.

Milestone 7: Final documentation completed.

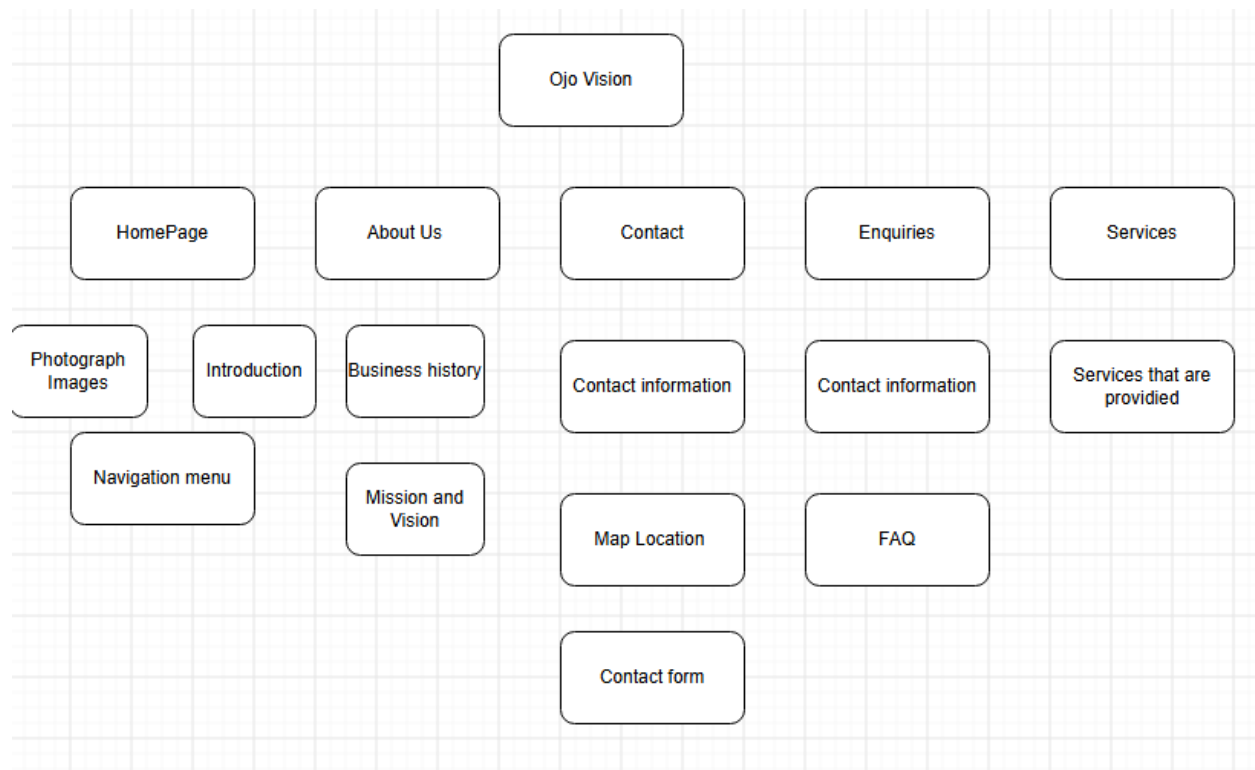

Milestone 8: Final website and project submitted.

Budget:

Developer Cost – R800

Web Hosting – R400

Basic Maintenance of the website – R1 500
